

目录

1 考点 1: Nominal Interest Rate & Real Interest Rate 名义利率和实际利率	2
题号 1 考察: 真实利率计算	2
题号 2 考察: 辨析名义利率、真实利率和通胀率之间关系	2
2 考点 2: Forward Rate Agreement(FRA) 远期利率协议	3
题号 1 考察: 远期利率协议价值计算 (注意折现的时点)	3
题号 2 考察: 远期利率协议 (注意辨析 FRA 多头和空头收益情况)	4
题号 3 考察: 远期利率协议 (FRA) 的支付计算	4
题号 4 考察: 远期利率协议 (FRA) 支付计算 (关键是掌握远期利率计算、利率转换以及 FRA 支付公式, 并准确代入数据计算)	4
题号 5 考察: 提前结算的远期利率协议 (FRA) 现金流计算 (关键是掌握提前结算 FRA 的现金流计算公式, 并准确代入参数进行计算)	5
题号 6 考察: 远期利率协议 (FRA) 和期货利率的关系 (关键是理解期货的盯市结算制度和 FRA 到期结算制度对利率的影响)	5
3 考点 3: Treasury Bond Futures(T - bond Futures) 长期国债期货	6
题号 1 考察: 最便宜可交割债券 (CTD) (关键是掌握交割成本计算公式)	6
题号 2 考察: 最便宜可交割债券 (注意辨析不同情况下 CTD 债券的特点)	7
题号 3 考察: 最便宜可交割债券 (注意 CTD 和 “百塔牌” 策略都是空头方用的, 对空头有利)	7
题号 4 考察: 欧洲美元期货远期利率计算 (掌握凸性调节部分公式, 尤其是 T2 的含义)	8
题号 5 考察: 欧洲美元期货价格 (注意期货价格与利率之间为反向关系)	8
题号 6 考察: 国债期货中最便宜可交割债券 (CTD) 的计算 (关键是掌握交割成本的计算公式)	9
题号 7 考察: 利率与债券期货价格的关系以及套期保值策略的选择 (关键是理解利率和债券价格的反向关系, 以及如何根据风险敞口选择合适的期货头寸进行套期保值)	9
题号 8 考察: Eurodollar 期货中考虑凸性调整的远期利率计算 (关键是掌握期货利率的计算、利率形式转换以及凸性调整公式)	10
题号 9 考察: 美国国债期货合约的交割机制、最便宜可交割债券的选择以及嵌入式期权对合约价值的影响 (关键是理解各种市场条件下不同因素对交割和合约价值的作用)	10

1 考点 1: Nominal Interest Rate & Real Interest Rate 名义利率和实际利率

1. A risk analyst at a fixed - income investment firm knows that the nominal interest rate on a bond is 8% and the inflation rate is 3%. What is the approximate real interest rate according to the simplified formula?

- A. 3%
- B. 4%
- C. 5%
- D. 6%

答案:C

解析:

步骤 1: 明确公式。

- 近似计算真实利率的公式为 $R_{real} \approx R_{nom} - R_{infl}$ ，其中 R_{nom} 是名义利率， R_{infl} 是通胀率。

步骤 2: 代入数据计算。

- 已知 $R_{nom} = 8\%$ ， $R_{infl} = 3\%$ ，将其代入公式可得 $R_{real} \approx 8\% - 3\% = 5\%$ 。

考察: 真实利率计算

2. A junior trader on a derivatives trading desk is analyzing the relationship between nominal and real interest rates. Which of the following statements is correct?

- A. The real interest rate is always higher than the nominal interest rate.
- B. The nominal interest rate is adjusted for inflation to get the real interest rate.
- C. The real interest rate is adjusted for inflation, and it can be approximated by subtracting the inflation rate from the nominal interest rate.
- D. The inflation rate is calculated by subtracting the nominal interest rate from the real interest rate.

答案:C

解析:

选项 A 错误。

- 通常情况下，名义利率包含了通胀补偿等因素，所以名义利率一般高于真实利率，而不是真实利率高于名义利率。

选项 B 错误。

- 是真实利率需要通过对名义利率进行通胀调整得到，而不是名义利率由真实利率调整而来。

选项 C 正确。

- 真实利率考虑了通胀因素，并且可以通过简化公式 $R_{real} \approx R_{nom} - R_{infl}$ 来近似计算，也就是用名义利率减去通胀率。

选项 D 错误。

- 根据真实利率的计算公式 $R_{real} \approx R_{nom} - R_{infl}$ ，变形可得 $R_{infl} \approx R_{nom} - R_{real}$ ，而不是用真实利率减去名义利率来计算通货膨胀率。

考察: 辨析名义利率、真实利率和通胀率之间关系

2 考点 2:Forward Rate Agreement(FRA) 远期利率协议

1. A financial advisor is evaluating a forward rate agreement. Assume the one - year zero rate is 3.5% and the eighteen - month zero rate is 4.5% with continuous compounding. What is the value of a forward rate agreement that allows the holder to earn 8% expressed with quarterly compounding, for a 6 - month period starting in one year on a notional of \$1,200,000?

- A. -\$7,814
- B. -\$8,092
- C. +\$7,814
- D. +\$8,092

答案:C

解析:

步骤 1：计算 1 年到 1.5 年的远期利率（连续复利）。

- 根据连续复利下远期利率公式 $r_f = \frac{r_2 \times t_2 - r_1 \times t_1}{t_2 - t_1}$ ，其中 $t_1 = 1$ 年， $t_2 = 1.5$ 年。代入可得 $r_f = \frac{0.045 \times 1.5 - 0.035 \times 1}{1.5 - 1}$ ，计算得出年化理论远期利率 $r_f = 0.065$ 。

步骤 2：计算 FRA 的价值。

- FRA 的价值为：

$$PV(\frac{(R_F - R_k)\tau L}{1 + R_F\tau})$$

- where R_{Forward} = forward rate between T_1 and T_2
- 代入已知数据，计算得出：

$$Value = (\frac{(0.08 \times 0.5 - (e^{0.065 \times 0.5} - 1)) \times 1200000}{e^{0.045 \times 1.5}}) = 7814$$

考察: 远期利率协议价值计算 (注意折现的时点)

2. A risk analyst at a bank is reviewing the characteristics of forward rate agreements (FRAs). Which of the following statements about FRAs is correct?

- A. FRAs are traded on organized exchanges, providing high liquidity and standardized terms.
- B. In a FRA, the interest rates are in compound interest form, similar to most other interest rate instruments.
- C. For a long FRA position, when the market interest rate rises, the position benefits as it receives a floating rate and pays a fixed rate.
- D. A short FRA position is also known as a fixed - rate payer, and it gains when the market interest rate falls.

答案:C

解析:

C 选项正确。

- 对于多头远期利率协议（Long FRA），其收取浮动利率，支付固定利率。当市场利率上升时，浮动利率升高，而支付的固定利率不变，所以收益增加。

A 选项错误。

- FRA 是在场外（OTC）市场交易，并非在有组织的交易所交易，不具备交易所交易的高流动性和标准化条款特点。

B 选项错误。

- 在 FRA 中，利率是单利形式（且是 30/360 day basis），不是复利形式，这与其他多数利率工具不同。

D 选项错误。

- 空头远期利率协议 (Short FRA) 是收取固定利率, 支付浮动利率, 也被称为 fixed - rate receiver。当市场利率下降时, 支付的浮动利率降低, 才会获利, 而不是固定利率 payer。

考察: 远期利率协议 (注意辨析 FRA 多头和空头收益情况)

3. An investor has entered into an FRA, agreeing to pay a fixed rate of 4% on \$1.5 million based on the quarterly rate in four months. Assume that rates are compounded quarterly. Calculate the payoff from the FRA if the quarterly rate is 2% in four months.

- A. -\$7,500
- B. -\$5,000
- C. \$5,000
- D. \$7,500

答案:A

解析:

步骤 1: 明确公式

- FRA 的支付公式为: 名义本金 $\times$ (浮动利率 - 固定利率) $\times$ 期限。这里名义本金是 1500000 美元, 固定利率 $r_f = 4\%$, 浮动利率 $r_l = 2\%$, 期限为季度, 即 0.25。

步骤 2: 计算支付金额

- 将数值代入公式可得: $1500000 \times (0.02 - 0.04) \times 0.25 = -7500$ 美元。

考察: 远期利率协议 (FRA) 的支付计算

4. Suppose the two - month and five - month floating rates are 3% and 4% respectively (continuously compounded rates). An investor enters into an FRA in which she will receive 7% (assuming quarterly compounding) on a principal of \$4,000,000 between Months 2 and 5. What is the payoff from the FRA?

- A. \$15,258
- B. \$20,345
- C. \$22,772
- D. \$30,567

答案:C

解析:

步骤 1: 计算远期利率 $R_{Forward}$

- 根据公式 $R_{Forward} = r_2 + (r_2 - r_1) \times \frac{t_1}{t_2 - t_1}$, 其中 $r_1 = 3\%$ (2 个月浮动利率), $r_2 = 4\%$ (5 个月浮动利率), $t_1 = \frac{2}{12}$, $t_2 = \frac{5}{12}$ 。
- 代入可得 $R_{Forward} = 0.04 + (0.04 - 0.03) \times \frac{2}{5-2} = 4.67\%$ 。

步骤 2: 将连续复利远期利率转换为季度复利远期利率

- 公式为 $R_{Forward}(\text{季度复利}) = 4 \times (e^{R_{Forward}/4} - 1) = 4 \times (e^{0.0467/4} - 1) = 4.70\%$ 。

步骤 3: 计算 FRA 的支付金额

- 支付公式为:

$$\begin{aligned} \text{payoff} &= \frac{\text{名义本金} \times (\text{合约利率} - \text{远期利率}) \times (\text{期限差})}{1 + r_2 \times (\text{期限差})} \\ &= \frac{4000000 \times (0.07 - 0.047) \times (\frac{5}{12} - \frac{2}{12})}{1 + 0.04 \times (\frac{5}{12} - \frac{2}{12})} \\ &= 22772.28 \text{ 美元} \end{aligned}$$

考察: 远期利率协议（FRA）支付计算（关键是掌握远期利率计算、利率转换以及 FRA 支付公式，并准确代入数据计算）

5. A financial manager at a firm is looking to hedge the interest - rate risk of a future borrowing. The firm plans to borrow \$15 million for 60 days starting in two years. The manager enters into a forward rate agreement (FRA) where the firm will pay a fixed rate, $R(k)$, of 4.5%. The FRA cash settles in two years ($T = 2.0$), not in arrears. All rates are expressed with quarterly compounding. If the actual 60 - day LIBOR observed two years forward turns out to be 5.5%, what is the cash flow payment/receipt by the firm under the FRA?

- A. The firm pays \$24,772
- B. The firm pays \$25,325
- C. The firm receives \$24,772
- D. The firm receives \$25,325

答案:A

解析:

步骤 1：明确 FRA 现金流计算公式

- 对于提前结算（settles in advance）的 FRA，现金流计算公式为： $V = \frac{L \times (r_{LIBOR} - r_{fixed}) \times t}{1 + r_{LIBOR} \times t}$ ，其中 L 是名义本金， r_{LIBOR} 是实际的 LIBOR 利率， r_{fixed} 是 FRA 的固定利率， t 是 FRA 的期限（年）。

步骤 2：确定各参数值

- 已知 $L = 15000000$ ， $r_{LIBOR} = 0.055$ ， $r_{fixed} = 0.045$ ， $t = \frac{60}{360} = \frac{1}{6}$ 。

步骤 3：计算现金流

- 将参数代入公式可得：

$$V = \frac{15000000 \times (0.055 - 0.045) \times \frac{1}{6}}{1 + 0.055 \times \frac{1}{6}} = 24772.91$$

- 因为 $r_{LIBOR} > r_{fixed}$ ，且公司是支付固定利率的一方，所以公司需要支付现金流。

考察: 提前结算的远期利率协议（FRA）现金流计算（关键是掌握提前结算 FRA 的现金流计算公式，并准确代入参数进行计算）

6. A risk analyst at a fixed - income investment firm is analyzing an FRA (forward rate agreement) that has the same maturity and compounding frequency as a Eurodollar futures contract. The FRA has a LIBOR underlying. Which of the following statements is true about the relationship between the forward rate and the futures rate?

- A. They should be exactly the same.
- B. The forward rate is normally lower than the futures rate.
- C. They have no fixed relationship.
- D. The forward rate is normally higher than the futures rate.

答案:B

解析:

B 选项正确。

- 由于期货合约是每日盯市结算（mark - to - market），当利率上升时，期货多头会收到现金并可以以更高的利率进行再投资；当利率下降时，期货空头会收到现金并可以以较低的成本进行再融资。而远期利率协议（FRA）在到期时才进行结算。
- 这种盯市结算的特点使得期货合约比 FRA 更具吸引力，投资者愿意为期货合约支付更高的价格，从而导致期货利率通常高于远期利率，即远期利率通常低于期货利率。

A 选项错误。

- 由于期货的盯市结算制度和 FRA 到期结算制度的差异，两者的利率通常是不同的，不会完全相同。

C 选项错误。

- 基于期货和 FRA 的结算机制，它们之间存在着相对固定的关系，并非没有固定关系。

D 选项错误。

- 实际情况是期货利率通常高于远期利率，而不是远期利率高于期货利率。

考察: 远期利率协议（FRA）和期货利率的关系（关键是理解期货的盯市结算制度和 FRA 到期结算制度对利率的影响）

3 考点 3:Treasury Bond Futures(T - bond Futures) 长期国债期货

1. A trader with a short position in a bond futures contract is looking to deliver a bond. Given the following options and a quoted price of 120.00, which bond is the cheapest - to - deliver (CTD)?

	Quoted Price	Conversion Factor
Bond A	105 - 08	0.8523
Bond B	112 - 16	0.9215
Bond C	130 - 24	1.0732

- A. Bond A
- B. Bond B
- C. Bond C
- D. None of the above

答案:B

解析:

步骤 1：将报价转换为小数形式

- Bond A 报价 105 - 08，转换为小数： $105 + \frac{8}{32} = 105.25$ 。
- Bond B 报价 112 - 16，转换为小数： $112 + \frac{16}{32} = 112.5$ 。
- Bond C 报价 130 - 24，转换为小数： $130 + \frac{24}{32} = 130.75$ 。

步骤 2：计算各债券的交割成本

- Bond A 的交割成本： $105.25 - 0.8523 \times 120 = 105.25 - 102.276 = 2.974$ 。
- Bond B 的交割成本： $112.5 - 0.9215 \times 120 = 112.5 - 110.58 = 1.92$ 。
- Bond C 的交割成本： $130.75 - 1.0732 \times 120 = 130.75 - 128.784 = 1.966$ 。
- 比较交割成本，Bond B 的交割成本最低。

考察: 最便宜可交割债券（CTD）（关键是掌握交割成本计算公式）

2. A risk analyst at a financial institution is studying the concept of the cheapest - to - deliver (CTD) bond in the context of bond futures contracts. Which of the following statements regarding CTD bonds is correct?

- A. When yields are above 6%, CTD bonds are typically low - coupon, short - maturity bonds.
- B. In an upward - sloping yield curve environment, CTD bonds tend to have shorter maturities.
- C. When yields are below 6%, the CTD bond is usually a high - coupon, short - maturity bond.
- D. The short position in a bond futures contract has no flexibility in choosing the bond for delivery.

答案:C

解析:

C 选项正确。

- 当收益率小于 6% 时，CTD 债券倾向于高息票、短期限债券，该选项正确。

A 选项错误。

- 当收益率大于 6% 时，CTD 债券倾向于低息票、长期限债券，而非高息票、短期限债券。

B 选项错误。

- 在收益率曲线向上倾斜时，CTD 债券倾向于长期限债券，因为长期限债券久期长，价格下降更多。

D 选项错误。

- 债券期货合约的空头方可以选择具体交割哪一个债券，具有一定的选择权。

考察: 最便宜可交割债券 (注意辨析不同情况下 CTD 债券的特点)

3. A junior trader is analyzing the implications of the cheapest - to - deliver (CTD) bond mechanism in bond futures contracts. Which of the following statements about the CTD bond and related strategies is accurate?

- A. When the yield curve is downward sloping, CTD bonds tend to have longer maturities.
- B. The "wild card play" strategy is only available to the long position in a bond futures contract.
- C. The ability to choose the CTD bond and use the "wild card play" generally increases the price of bond futures contracts.
- D. The calculation of the cost for delivering a bond involves the quoted bond price, quoted futures price, and the conversion factor.

答案:D

解析:

D 选项正确。

- 根据最便宜可交割债券交割成本计算公式 $Cost = QBP - (QFP \times CF)$ (其中 QBP 为债券报价, QFP 为期货报价, CF 为转换因子), 交割成本计算涉及这些要素。

A 选项错误。

- 收益率下行, 债券价格上升, 期限更短的债券久期更短, 价格上升更少, 因此 CTD 倾向于期限更短的债券。

B 选项错误。

- “百塔牌”策略 (wild card play) 是空头方在交割月期间可利用的策略, 用于选择交割时间以降低成本, 并非多头方可用。

C 选项错误。

- 空头方选择 CTD 债券和使用“百塔牌”策略的能力, 给予空头方高度选择权, 往往会降低期货合约价格, 而非提高。

考察: 最便宜可交割债券 (注意 CTD 和“百塔牌”策略都是空头方用的, 对空头有利)

4. Suppose a Eurodollar futures quote is 96.80, the standard deviation of the change in the monthly rate over one year is 1.5%, and the time to maturity is two years. Ignoring compounding effects, what is the forward rate?

- A. 3.05%
- B. 3.15%
- C. 3.45%
- D. 3.65%

答案:B

解析:

C 选项正确。

- 根据期货报价计算期货利率，期货利率 $r_f = 100 - 96.80 = 3.2\%$ ，即 0.032；标准偏差 $\sigma = 0.015$ ；时间到到期 $T_{12} = 2$ 年。
- 远期利率计算公式：

$$\text{forward rate} = \text{futures rate} - \left(\frac{1}{2} \sigma^2 \times T_1 \times T_2 \right)$$

- 代入数据可得：

$$\text{forward rate} = 0.032 - \left(\frac{1}{2} \times 0.015^2 \times 2 \times 2.25 \right) = 3.15\%$$

考察: 欧洲美元期货远期利率计算 (掌握凸性调节部分公式，尤其是 T2 的含义)

5. A trader holds a long position in a Eurodollar futures contract. The price of the Eurodollar futures changes from 98.00 to 97.20. What is the gain/loss to the trader, considering the relationship with SOFR?

- A. SOFR decreased by 80 basis points, resulting in a loss of \$2,000 for the long position.
- B. SOFR increased by 80 basis points, resulting in a loss of \$2,000 for the long position.
- C. SOFR decreased by 80 basis points, resulting in a gain of \$2,000 for the long position.
- D. SOFR increased by 80 basis points, resulting in a gain of \$2,000 for the long position.

答案:B

解析:

B 选项正确。

- 对于欧洲美元期货，其价格与利率呈反向关系。期货价格从 98.00 下降到 97.20，价格变动了 $98.00 - 97.20 = 0.8$ ，意味着利率（这里是 SOFR）上升了 $0.8 \times 100 = 80$ 个基点。
- 对于多头头寸，利率上升会导致合约价值下降，产生损失。一份欧洲美元期货合约的最小变动值为 25 美元（对应一个基点的变动），这里变动了 80 个基点，损失为 $25 \times 80 = 2000$ 美元。

考察: 欧洲美元期货价格 (注意期货价格与利率之间为反向关系)

6. The yield curve is upward sloping. A trader has a short Treasury bond futures position. The following bonds are eligible for delivery:

Bond	A	B	C
Spot price	104 - 16/32	108 - 20/32	100 - 14/32
Coupon	4.5%	5.5%	3.5%
Conversion factor	0.99	1.04	0.96

The futures price is 105 - 18/32 and the maturity date of the contract is October 1. The bonds pay their coupon semiannually on July 31 and January 31. Which is the cheapest to deliver bond?

- A. Bond A
- B. Bond B
- C. Bond C
- D. Insufficient information

答案:B

解析:

步骤 1: 明确最便宜可交割债券 (CTD) 的计算方法

- 计算交割成本 (Cost of Delivery, COD)，公式为： $COD = \text{现货价格} - \text{期货价格} \times \text{转换因子}$ 。

步骤 2：分别计算各债券的交割成本

- 对于 Bond A： $(104 - 16/32) - (105 - 18/32) \times 0.99 = 104.5 - 105.56 \times 0.99 = -0.0044$
- 对于 Bond B： $(108 - 20/32) - (105 - 18/32) \times 1.04 = 108.625 - 105.56 \times 1.04 = -1.1574$ 。
- 对于 Bond C： $(100 - 14/32) - (105 - 18/32) \times 0.96 = 100.4375 - 105.56 \times 0.96 = -0.9001$ 。

步骤 3：比较交割成本并确定 CTD

- 比较 COD_A 、 COD_B 、 COD_C 的大小， $-1.1574 < -0.9001 < -0.0044$ ，Bond B 的交割成本最低。

考察：国债期货中最便宜可交割债券（CTD）的计算（关键是掌握交割成本的计算公式）

7. A French real - estate company is looking to hedge against the risk of increasing interest rates. It decides to use futures on 15 - year French government bonds. Which position in the futures should the company take, and what is the reason?

- A. Take a long position in the futures because rising interest rates lead to declining futures prices.
- B. Take a short position in the futures because rising interest rates lead to declining futures prices.
- C. Take a long position in the futures because rising interest rates lead to rising futures prices.
- D. Take a short position in the futures because rising interest rates lead to rising futures prices.

答案:B

解析：

B 选项正确。

- 债券价格和利率呈反向关系。当利率上升时，债券的未来现金流折现到现在的价值会降低，从而导致债券价格下降。而债券期货价格与标的债券价格走势一致，所以利率上升会使债券期货价格下降。
- 该法国房地产公司想要对冲利率上升的风险，采取期货空头头寸（short position）。当利率上升导致期货价格下降时，空头头寸会盈利，从而抵消公司在利率上升环境中可能面临的损失，达到套期保值的目的。

A 选项错误。

- 虽然利率上升会使期货价格下降，但采取多头头寸（long position）在期货价格下降时会遭受损失，无法对冲利率上升的风险。

C 选项错误。

- 利率上升会使债券价格和期货价格下降，而不是上升，所以该选项关于利率和期货价格关系的描述错误。

D 选项错误。

- 利率上升会使债券价格和期货价格下降，并非上升，此选项对利率和期货价格关系的判断有误。

考察：利率与债券期货价格的关系以及套期保值策略的选择（关键是理解利率和债券价格的反向关系，以及如何根据风险敞口选择合适的期货头寸进行套期保值）

8. The five - year Eurodollar futures quote is 96.50. The volatility of the short - term interest rate (LIBOR) is 1.2%, expressed with continuous compounding. What is the equivalent forward rate, adjusted for convexity, given in ACT/360 day count with continuous compounding (i.e., the Eurodollar futures contract gives LIBOR in quarterly compounding ACT/360, so convert to continuous but a day count conversion is not needed)?

- A. 3.29%
- B. 3.43%
- C. 3.55%

D. 3.60%

答案:A

解析:

步骤 1：计算期货利率（年化）

- 已知期货报价为 96.50，则期货利率（年化）

$$futures\ rate(annual) = (100 - 96.5)\% = 3.5\%$$

步骤 2：计算季度期货利率

- 因为一年按 360 天算，季度为 90 天，所以季度期货利率 $futures\ rate(quarterly) = 3.5\% \times \frac{90}{360} = 0.875\%$ 。

步骤 3：将季度期货利率转换为连续复利形式

- 根据公式 $r_{cont} = \ln(1 + r_{disc})$ (r_{cont} 为连续复利利率， r_{disc} 为离散复利利率)，这里 $r_{disc} = 0.00875$ ，则

$$futures\ rate(continuous) = \ln(1 + 0.00875) \times \frac{360}{90} = 3.48\%$$

步骤 4：计算考虑凸性调整后的远期利率

- 已知凸性调整公式 $futures\ rate = forward\ rate + \frac{1}{2}\sigma^2t_1t_2$ ，其中 $\sigma = 1.2\%$ ， $t_1 = 5$ ， $t_2 = 5.25$ （五年期 Eurodollar 期货相关时间参数）。
- 则 $forward\ rate = 3.48\% - \frac{1}{2}(0.012^2) \times 5 \times 5.25 = 3.29\%$ 。

考察: Eurodollar 期货中考虑凸性调整的远期利率计算（关键是掌握期货利率的计算、利率形式转换以及凸性调整公式）

9. A junior trader on a derivatives trading desk is in charge of tracking the US Treasury bond futures contracts. The trader needs to understand how market conditions influence the choice of the cheapest - to - deliver bonds and how the delivery process affects the futures price. Which of the following statements about the delivery of US Treasury bond futures contracts is correct?

- A. The “wild card play” benefits the short - position holders in expiring futures contracts by allowing them to choose the delivery time.
- B. The embedded options associated with delivery against a US Treasury futures contract tend to decrease the value of the contract.
- C. As bond yields decrease, long - maturity bonds with high coupons will tend to be the cheapest - to - deliver.
- D. An upward - sloping yield curve makes it more likely that long - maturity bonds will be cheapest - to - deliver.

答案:A

解析:

A 选项正确。

- “Wild card play” 是指在国债期货合约到期时，空头方在一定时间内有选择交割时间的权利。
- 空头方可以根据市场情况，选择对自己最有利的的时间进行交割，从而受益。

B 选项错误。

- 美国国债期货合约交割相关的嵌入式期权赋予了空头方一些权利，如选择交割债券的种类、交割时间等。
- 这些权利增加了合约对于空头方的价值，而多头方需要为此付出代价，所以会增加合约的价值，而不是降低。

C 选项错误。

- 当债券收益率下降时，低息票、短期限的债券价格上升幅度相对较小，其净基差（债券现货价格 - 期货价格 × 转换因子）更有可能为负且绝对值更大，更倾向于成为最便宜可交割债券，而不是高息票、长期限的债券。

D 选项错误。

- 向上倾斜的收益率曲线意味着短期利率低于长期利率。在这种情况下，短期债券的融资成本相对较低，使得短期债券更有可能成为最便宜可交割债券，而不是长期债券。

考察: 美国国债期货合约的交割机制、最便宜可交割债券的选择以及嵌入式期权对合约价值的影响（关键是理解各种市场条件下不同因素对交割和合约价值的作用）
